Before Seguro Popular (2003)

- Two public healthcare providers:
 - IMSS (Mexican Institute of Social Security)
 - ISSTE (Institute of Security and Social Services for State Workers)
- All workers have a right to affiliate with IMSS but employers have to pay a minimum fee for each worker
- State workers affiliate with ISSTE
- Contract workers, unemployed etc. must purchase private insurance
- 50 million uninsured Mexicans (more than half of the population!)
- No regular access to health care, particularly those with low income
- Negative consequences:
 - large out-of-pocket healthcare expenditures
 - 2 less access to and reduced quality in health services
 - inefficient use of resources

Seguro Popular: A Massive Reform

Article 4 of the Mexican constitution:

all persons have a right to the protection of their health

- Medical services, preventive care, pharmaceuticals, and financial health protection
- Voluntary and available for everyone but free to the poor
- Beneficiaries: intended to cover (by 2012) all 50M Mexicans who otherwise have no access to the healthcare system
- Cost in 2005: \$800 million in new money
- One of the largest health reforms of any country in last 2 decades
- Most visible accomplishment of the Fox administration
- Major issue in the 2006 presidential campaign
- Initial result: 20M beneficiaries by the end of 2007
- Still going: The World Bank just approved a \$1.25 billion loan to cover additional 10M Mexicans

Goals of SP & Evaluation Outcome Measures

- Financial Protection (money for the poor rarely makes it there)
 - Out-of-pocket expenditure
 - Catastrophic expenditure (8.4% of households, spend > 30% of annual disposable income on health)
 - Impoverishment due to health care payments
- Health System Effective Coverage
 - Percent of population receiving appropriate treatment by disease
 - Satisfaction of affiliates with Seguro Popular
- Health Care Facilities
 - Operations, office visits, emergencies, personnel, infrastructure and equipment, drug inventory.
- Health
 - Health status
 - All-cause mortality
 - Cause-specific mortality

SP Evaluation

- Frenk and Fox asked: How can one democratically elected government "tie the hands" of their successors?
 - Commission an independent evaluation
 - (They are true believers in SP)
 - Like in science: make themselves vulnerable to being proven wrong
 - If we show SP is a success: elimination would be difficult
 - If SP is a failure: who cares about extending it
- The largest randomized health policy experiment in history
- One of the largest policy experiments to date
- First cohort: 148 geographic areas, 1,380 localities, approximately 118,569 households, and about 534,457 individuals

Lessons from Previous Public Policy Experiments

- Most large scale public policy experiments fail
- Many failures are political
 - politicians: need to pursue short term goals
 - citizens: you plan to randomly assign me?
 - all perfectly legitimate; a natural consequence in a democracy
- E.g., Oportunidades program: Some governors "miraculously" found money for control groups to participate too (numerous similar examples worldwide)
- Previous evaluation designs ignored democratic politics
- We developed a new research design & new methods for Mexico:
 - includes fail-safe components for when politics intervenes
 - uses data far more efficiently to find effects and save money

Example of Fail-Safe Design Procedure (CR vs. MPR)

- Complete Randomization (used in Oportunidades evaluation)
 - Flip coin to assign program to each area
- Matched-Pair Randomization (used in Seguro Popular evaluation)
 - Match areas in pairs on background characteristics
 - Flip coin once for each pair: one area within each pair gets the program
 - If one area is lost:
 - Drop the other member of the pair
 - Remaining pairs are kept
 - Treated and control groups are still protected by randomization: advantages of the experiment survives
 - With our new statistical methods, the design:
 - Smaller standard errors: up to 6 times smaller!
 - We can find effects where complete randomization cannot
 - Far less expensive for the same impact

Detailed Design Summary

- Define 12,284 "health clusters" that tile Mexico's 31 states; each includes a health clinic and catchment area
- Persuaded 13 of 31 states to participate (7,078 clusters)
- Match clusters in pairs on background characteristics.
- Select 74 pairs (based on necessary political criteria, closeness of the match, likelihood of compliance)
- Randomly assign one in each pair to receive encouragement to affiliate, better health facilities, drugs, and doctors
- Conduct baseline survey of each cluster's health facility
- Survey ≈32,000 random households in 50 of the 74 treated and control unit pairs (chosen based on likelihood of compliance with encouragement and similarity of the clusters within pair)
- Repeat surveys in 10 months and subsequently to see effects

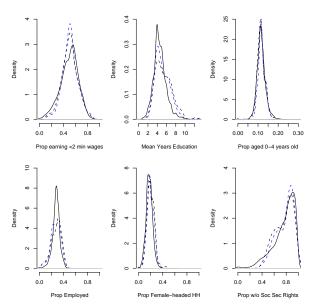

Matched-Pair Cluster-Randomized Designs in Polisci

- Special research designs require special methods
- Prop. of polisci CREs which ignore the design: 100%
- Prop. of polisci CREs making more assumptions than necessary: 100%
- MPDs
 Complete Randomization w.r.t.: efficiency, bias, power, estimator simplicity, and robustness to political intervention
- Proportion of previous CREs in polisci that use MPDs: 0%
- Conclusion: we're leaving a lot of information on the table!
- Imai-King-Nall: prove above results and offer simple estimators for MPDs making minimal assumptions for both intent to treat and complier average treatment effects

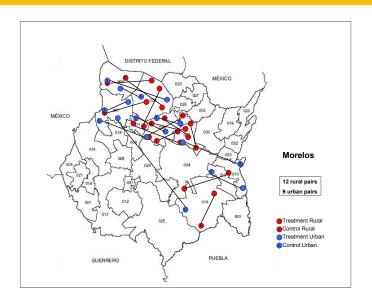

Remaining in study: 148 clusters (74 pairs) in 7 states

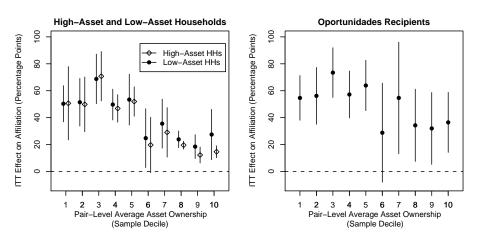

Clusters are Representative On Measured Variables

Matched Pairs, Morelos

Effect of Encouragement on Seguro Popular Affiliation

 Households in poorer areas have higher estimated average causal effects on their affiliation rate

Effect on % of Households with Catastrophic Expenditures

Conclusions

- Positive effects detected now:
 - Catastrophic expenditures slashed
 - In-patient out-of-pocket expenditures drastically reduced
 - Out-patient out-of-pocket expenditures drastically reduced
 - Citizen satisfaction is high
- Positive effects not yet seen:
 - Expenditures on medicines
 - Utilization (preventative and procedures)
 - Risk factors
- Other findings:
 - Only 66% of automatically affiliated Oportunidades respondents were aware of this fact
 - More encouragement to affiliate might be devoted to finding the poor hidden within relatively "wealthier" clusters
 - Developed new and more powerful evaluation design and statistical methods, tuned to the needs of Mexico
 - These design and statistical methods are widely applicable

Future Work

- Continued evaluation of long-term effects
- Political and economic consequences of Seguro Popular
- Merging municipality-level electoral data with evaluation data
- Does the receipt of health insurance change voting behavior?
